EpiQuik™ Global Histone H3 Phosphorylation (Ser10) Assay Kit (Colorimetric)

Base Catalog # P-7002

PLEASE READ THIS ENTIRE USER GUIDE BEFORE USE

The EpiQuik™ Global Histone H3 Phosphorylation (Ser10) Assay Kit (Colorimetric) is suitable for specifically measuring global histone H3 phosphorylation at ser10 using a variety of mammalian cells (human, mouse, etc.) including fresh and frozen tissues, and cultured adherent and suspension cells.

* For maximum recovery of the products, centrifuge the original vial prior to opening the cap.

SHIPPING & STORAGE

The kit is shipped in two parts, one part at ambient room temperature, and the second part on frozen ice packs at 4°C.

Upon receipt: (1) Store C3 and the Standard Control at –20°C; (2) Store C5 at room temperature away from light; (3) Store all other components at 4°C away from light. The kit is stable for up to 6 months from the shipment date, when stored properly.

**Note:** Check if buffers, C1 and C2, contain salt precipitates before using. If so, warm (at room temperature or 37°C) and shake the buffers until the salts are re-dissolved.

MATERIALS REQUIRED BUT NOT SUPPLIED

- Orbital shaker
- Pipettes and pipette tips
- Reagent reservoir
- Microplate reader

GENERAL PRODUCT INFORMATION

**Usage Limitation:** The EpiQuik™ Global Histone H3 Phosphorylation (Ser10) Assay Kit (Colorimetric) is for research use only and is not intended for diagnostic or therapeutic application.

**Quality Control:** Epigentek guarantees the performance of all products in the manner described in our product instructions.
**Safety:** Suitable lab coat, disposable gloves, and eye protection are required when working with the kit.

**Product Updates:** Epigentek reserves the right to change or modify any product to enhance its performance and design.

**Intellectual Property:** The EpiQuik™ Histone H3 Phosphorylation (Ser10) Assay Kit and methods of use contain proprietary technologies by Epigentek. EpiQuik™ is a trademark of Epigentek Group Inc.

---

**A BRIEF OVERVIEW**

The phosphorylation of histone H3 at serine 10 is conserved through eukaryotes, and an increase in phosphorylation has been shown to correlate with gene activation and cell growth. *In vitro* studies have shown that phosphorylation of histone H3 at ser10 is coupled to acetylation at the nearby Lysine-14 residue. Histone H3 phosphorylation at ser10 is also negatively impacted by histone methylation at lysine 9. It was observed that histone H3 phosphorylation at ser10 is regulated by the cell cycle and has been used as mitotic marker. H3 phosphorylation (ser10) is critical for neoplastic cell transformation. Several protein kinases, including aurora B, PPI, and PKC, are responsible for histone H3 phosphorylation at ser10. Inhibition or activation of these protein kinases can cause the change in intracellular histone H3 phosphorylation at ser10. Detection in the change of histone H3 phosphorylation at ser10 associated with cell cycle, apoptosis, and inhibitor or activator treatment, would provide useful information for better understanding the pathological process of some diseases, and for protein kinase-targeted drug development. The EpiQuik™ Global Histone H3 Phosphorylation (Ser10) Assay Kit (Colorimetric) provides a tool for measuring global phospho histone H3 (ser10). The kit has the following features:

- Quick and efficient procedure, which can be finished within 3 hours.
- Innovative colorimetric assay without the need for radioactivity, electrophoresis, or chromatography.
- Specifically captures phospho histone H3 (ser10) with the detection limit as low as 2 ng/well.
- The control is conveniently included for the quantification of phosphorylated histone H3 (ser10).
- Strip microplate format makes the assay flexible: manual or high throughput.
- Simple, reliable, and consistent assay conditions.

---

**PRINCIPLE & PROCEDURE**

The EpiQuik™ Global Histone H3 Phosphorylation (Ser10) Assay Kit (Colorimetric) is designed for measuring global histone H3 phosphorylation at ser10. In an assay with this kit, the phosphorylated histone H3 at ser10 is captured to the strip wells coated with an anti-phospho histone H3 (ser10) antibody. The captured phospho histone H3 (ser10) can then be detected with a labeled detection antibody, followed by a color development reagent. The ratio of phospho...
histone H3 (ser10) is proportional to the intensity of absorbance. The absolute amount of phospho histone H3 (ser10) can be quantitated by comparing to the standard control.

PROTOCOL

1. **a)** Prepare histone extracts from cells/tissues treated or untreated by using your own successful method (acid extraction or high salt extraction).
   **b)** For your convenience and the best results, Epigentek offers the EpiQuik™ Total Histone Extraction Kit (Cat. No. OP-0006) optimized for use in the EpiQuik™ modified histone quantification series.
   **c)** Preparation of histone extracts can also be performed using the attached procedure. Histone extracts can be used immediately or stored at –80°C for future use.

2. Determine the number of strip wells required. Leave these strips in the plate frame (remaining unused strips can be placed back in the bag. Seal the bag tightly and store at 4°C). Dilute C1 with distilled water (pH 7.2-7.5) at a 1:9 ratio (ex: 1 ml of C1 + 9 ml of water).

3. Add 50 µl of C2 into each well. For the sample, add 1-2 µg of the histone extract into the sample wells. For the standard curve, dilute the Standard Control with C2 to 1–100 ng/µl at 5-7 points (e.g., 1.5, 3, 6, 12, 25, 50, and 100 ng/µl). Add 1 µl of Standard Control at the different concentrations into the standard wells. For the blank, do not add any nuclear extracts or standard control protein. Mix and cover the strip wells with Parafilm M and incubate at room temperature for 1-2 hours.

4. Aspirate and wash the wells with 150 µl of diluted C1 three times.
5. Dilute C3 (at a 1:1000 ratio) to 1 µg/ml with C2. Add 50 µl of diluted C3 to each well and incubate at room temperature for 60 minutes on an orbital shaker (100 rpm).

6. Aspirate and wash the wells with 150 µl of diluted C1 six times.

7. Add 100 µl of C4 into the wells and incubate at room temperature for 2-10 minutes away from light. Monitor the color development in the sample and standard wells (blue).

8. Add 50 µl of C5 to each well to stop enzyme reaction when the color in the standard wells containing the higher concentrations of standard control turns medium blue. The color should change to yellow and absorbance can be read on a microplate reader at 450 nm within 2-15 minutes.

9. Calculate % histone H3 phospho (ser10):

   \[
   \text{Phospho (ser10) \%} = \frac{\text{OD (treated (tested) sample – blank)}}{\text{OD (untreated (control) sample – blank)}} \times 100\%
   \]

   For the amount quantification, plot OD versus amount of Standard Control and determine the slope as delta OD/ng.

   Calculate the amount of phospho (ser10) using the following formula:

   \[
   \text{Amount (ng/mg protein)} = \frac{\text{OD (sample – blank)}}{\text{slope}} \times 1000
   \]

**PLATE CONFIGURATION**

![Plate Configuration Diagram]
• Strip 1-3 (for 96 assays) or strip 1-2 (for 48 assays) - standard wells (labeled as SC); the standard curve can be generated with 5-8 concentration points (includes blank).
• Example amount of standard control/well - A1: 100 ng; B1: 50 ng; C1: 25 ng; D1: 12 ng; E1: 6 ng; F1: 3 ng; G1: 1.5 ng; H1: 0 ng.
• Strip 4-12 (for 96 assays) or strip 3-6 (for 48 assays) - sample wells (no label).
• Each sample or standard point can be assayed in duplicates or triplicates.

Histone Extraction Protocol

1. For tissues (treated and untreated), weigh the sample and cut the sample into small pieces (1-2 mm³) with a scalpel or scissors. Transfer tissue pieces to a Dounce homogenizer. Add TEB buffer (PBS containing 0.5% Triton X 100, 2 mM PMSF and 0.02% NaN₃) at 1 ml per 200 mg of tissue, and disaggregate tissue pieces by 50-60 strokes. Transfer homogenized mixture to a 15 ml conical tube and centrifuge at 3000 rpm for 5 minutes at 4°C. If total mixture volume is less than 2 ml, transfer mixture to a 2 ml vial and centrifuge at 10,000 rpm for 1 minute at 4°C. Remove supernatant.

For cells (treated and untreated), harvest cells and pellet the cells by centrifugation at 1000 rpm for 5 minutes at 4°C. Resuspend cells in TEB buffer at 10⁷ cells/ml and lyse cells on ice for 10 minutes with gentle stirring. Centrifuge at 3000 rpm for 5 minutes at 4°C. If total volume is less than 2 ml, transfer cell lysates to a 2 ml vial and centrifuge at 10,000 rpm for 1 minute at 4°C. Remove supernatant.

2. Resuspend cell/tissue pellet in 3 volumes (approx. 200 µl/10⁷ cells or 200 mg of tissue) of extraction buffer (0.5N HCl + 10% glycerol) and incubate on ice for 30 minutes.

3. Centrifuge at 12,000 rpm for 5 minutes at 4°C and remove the supernatant fraction to a new vial.

4. Add 8 volumes (approx. 0.6 ml/10⁷ cells or 200 mg of tissue) of acetone and leave at –20°C overnight.

5. Centrifuge at 12,000 rpm for 5 minutes and air-dry the pellet. Dissolve the pellet in distilled water (30-50 µl/10⁷ cells or 200 mg of tissue).

6. Quantify the protein concentration. Aliquot the extract and store the extract at –20°C or –80°C.

TROUBLESHOOTING

No Signal for Both the Standard Control and the Samples

Reagents are added incorrectly. Check if reagents are added in order and if any steps of the procedure may have been omitted by mistake.
Incubation time and temperature are incorrect. Ensure the incubation time and temperature described in the protocol are followed correctly.

**No Signal or Very Weak Signal for Only the Standard Control**

The amount of standard control is not added into the “standard control wells,” or is added insufficiently. Ensure a sufficient amount of control is properly added to the standard control wells.

**No Signal for Only the Sample**

The protein sample is not properly extracted. Ensure the procedure and reagents are correct for the nuclear protein extraction.

The protein amount is added into well insufficiently. Ensure extract contains a sufficient amount of protein.

Protein extracts are stored incorrectly. Ensure the protein extracts are stored at –20°C or –80°C.

**High Background Present for the Blank**

The well is not washed sufficiently. Check if wash at each step is performed according to the protocol.

Contaminated by the standard control. Ensure the well is not contaminated from adding the control protein or from using control protein contaminated tips.

Overdevelopment. Decrease development time in step 7
